# Soil Series of the United States, Including Puerto Rico and the U.S. Virgin Islands: Their Taxonomic Classification

## Introduction

This publication gives the present classification of all soil series that either have been mapped and described in published soil surveys in the United States, including Puerto Rico and the U.S. Virgin Islands, or that are currently in use and may later be described in published soil surveys.

The classification is given in two lists. One is an alphabetical list of soil series and the other is a list of soil families and their included series. The series list gives their classification or gives the reason why they are not classified. Conventional alphabetizing has been modified to facilitate computer programming. For example, the names St. Clair and Snake River are treated as single words and abbreviations are listed as they are written rather than as the words for which they stand. Thus, Snake Hollow precedes St. Clair. In addition, a period or a space is equivalent to a character (a letter) and precedes the letter *a*. As a consequence, Snake Hollow precedes Snakelum because Snakelum has no space or period before the letter *l*.

The letters that precede some soil series names in this alphabetical listing have the following meanings:

- I, an inactive series not currently used
- P, a provisional classification
- T, a tentative series

The series name is followed by the name of the State that contains the present type location of the series. Some names may have originated in a different State.

The second list is of soil families and their included series. The families are arranged alphabetically by orders, suborders, and great groups. Subgroups are arranged alphabetically within each great group except that the typic subgroup is always listed first. Families within a subgroup are listed in approximate order of decreasing particle size. If several families have the same particle-size class, they are arranged alphabetically by mineralogy class, reaction class, temperature class, and so on.

## The Soil Series

In the United States, soil surveys started in 1899, and describing and mapping soil series began in 1903. The number of soil series grew rapidly during the first few years, but at that time the concept of what constitutes a series was different from the concept now accepted. For example, the initial concept of the Miami series could have any texture and any drainage. This series was identified from Kentucky to North Dakota and in all glaciated areas to the north and east. It included the Alfisols, Inceptisols, Mollisols, and Spodosols formed in loess, outwash, and till. Soil surveys published about 1903 reflect that concept, but it was soon changed.

By 1909, Whitney<sup>1</sup> wrote that color and structure determine a series and that texture determines the place of a soil within the series, namely, the type. New series were set apart on the basis of soil properties as rapidly as the significance of a property to use of a soil was understood. Soils in the Marshall series were cut out of the Miami

CATALOGING

series because of their thick, dark surface horizon. The Marshall series at first also included soils formed in loess, till, and outwash. It was soon subdivided. The Carrington series soils formed in till was one of the early series cut out of the Marshall series. But the Carrington series was soon divided and redivided in turn. Soil maps published between 1910 and 1920 show soils in the Carrington series in places where now soils in more than a dozen series are mapped.

For the first three decades of soil surveys, series were defined partly by the "soil province" in which they occurred. The soil provinces were large areas in which the geologic history was reasonably similar. Examples are the Atlantic and Gulf Coastal Plain and the Glacial and Loessial Province. The first publication in which the soils of the United States were described was issued in 1909. About 230 series and 700 types were listed. The next publication,<sup>2</sup> issued in 1913, listed about 550 series that were divided into one or two thousand types and phases.

By the 1930's, Marbut<sup>3</sup> developed the first hierarchical classification of soils, but only a few series were related to the great soil groups. At that time about 1,500 series were divided into approximately 5,000 types.

In 1938, another system of classification was published,<sup>4</sup> and again most of the series were not related to the great soil groups. At this time about 2,000 series were divided into about 6,000 types. By 1964, about 8,000 series had been recognized.

In 1965, after about 15 years of study, the National Cooperative Soil Survey began using the present taxonomy. Some 17,371 series are listed in this publication, 1,210 of which are inactive. Some of the older series that were broadly defined are not classified. The classification for some series is marked as provisional, but most classifications are not. The reader who uses this book as reference must understand that:

1. The classification of all series is provisional to some extent, and changes can be expected as we learn. The taxonomy itself will change. Any series classification subsequent to the date of this publication should take precedence if it differs from the classification given here.
2. The classification reflects the current concept of a series, which is not necessarily the same concept that was held in previous years. Series names in earlier publications do not necessarily reflect the present concepts. Generally, the older the publication, the less likely is the concept to be the same.

### The meanings in the names

The names in the alphabetical list give the family classification of each soil series. The families that have been recognized and their included series are named in the second list. A series name is an abstract name, usually taken from the name of a town or landscape feature near the place where the series was first described, but the names of the families are descriptive if the reader understands the meanings of the formative elements in the names. Complete definitions are given in Soil Taxonomy.<sup>5</sup>
